# DYNAMIC PROGRAMMING

# **Dynamic Programming**

**Dynamic Programming (DP)** is an algorithm technique used to solve problems that can be broken down into **simpler, overlapping subproblems.** 

### **Key Concepts of Dynamic Programming**

- Overlapping subproblems: a problem has overlapping subproblems if it can be broken down into subproblems.
- **Memoization (Top-Down Approach)**: store the results in a cache (typically a dictionary or array) to avoid recalculation recursion and caching approach.
- **Tabulation (Bottom-Up Approach)**: first solve all possible subproblems iteratively, and store them in a table.

# **Common Patterns in Dynamic Programming**

- Toy example (Fibonacci): Climbing Stairs, N-th Tribonacci Number, Perfect Squares
- Constant Transition: Min Cost Climbing Stairs, House Robber, Decode Ways, Minimum Cost For Tickets, Solving Questions With Brainpower
- Grid: Unique Paths, Unique Paths II, Minimum Path Sum, Count Square Submatrices with All Ones, Maximal Square,
   Dungeon Game
- Dual-Sequence: Longest Common Subsequence, Uncrossed Lines, Minimum ASCII Delete Sum for Two Strings, Edit
   Distance, Distinct Subsequences, Shortest Common Supersequence
- Interval: Longest Palindromic Subsequence, Stone Game VII, Palindromic Substrings, Minimum Cost Tree From Leaf Values, Burst Balloons, Strange Printer
- Longest Increasing Subsequence: Count Number of Teams, Longest Increasing Subsequence, Partition Array for Maximum Sum, Largest Sum of Averages, Filling Bookcase Shelves
- Knapsack: Partition Equal Subset Sum, Number of Dice Rolls With Target Sum, Combination Sum IV, Ones and Zeroes,
   Coin Change, Coin Change II, Target Sum, Last Stone Weight II, Profitable Schemes
- Topological Sort on Graphs: Longest Increasing Path in a Matrix, Longest String Chain, Course Schedule III
- DP on Trees: House Robber III, Binary Tree Cameras
- Other problems: 2 Keys Keyboard, Word Break, Minimum Number of Removals to Make Mountain Array, Out of Boundary Paths

### **Credits**

# Dynamic Programming – Example – Fibonacci Sequence

```
Naive Recursive Approach

int fib(int n) {
   if (n <= 1) {
      return n;
   }
   return fib(n - 1) + fib(n - 2);
}</pre>
```

```
Memoization (Top-Down DP)

std::unordered_map<int, int> memo;

int fib(int n) {
    if (n <= 1) {
        return n;
    }
    if (memo.find(n) != memo.end()) {
        return memo[n];
    }
    memo[n] = fib(n - 1) + fib(n - 2);
    return memo[n];
}</pre>
```

```
Tabulation (Bottom-up DP)

int fib(int n) {
    if (n <= 1) {
        return n;
    }
    int dp[n + 1];
    dp[0] = 0;
    dp[1] = 1;
    for (int i = 2; i <= n; i++) {
        dp[i] = dp[i - 1] + dp[i - 2];
    }
    return dp[n];
}</pre>
```

# **Problem – Climbing Stairs**

leetcode.com/problems/climbing-stairs

### **Problem Statement**

You need to climb a staircase with n steps to get to the top. Each time you can choose to climb either 1 step or 2 steps at a time. Find out how many different ways you can climb to the top of the staircase.

### Example 1

Input: n = 2

Output: 2

Explanation: There are two ways to get to the top

- 1. Climb 1 step at a time, twice
- 2. Climb 2 steps in one go

### Example 2:

**Input:** n = 3

Output: 3

**Explanation:** There are three ways to get to the top:

- 1. Climb 1 step at a time, three times
- 2. Climb 1 step, then 2 steps
- 3. Climb 2 steps, then 1 ste.

# Solution – Climbing Stairs

leetcode.com/problems/climbing-stairs

```
std::unordered map<int, int> memo;
int climbStairs(int n) {
   // Identify the sequence, when:
   // n = 0 (0 way), there is no way to get up
   // n = 1 (1 way): only one way : 1-step
   // n = 2 (2 ways): 1s + 1s | 2s
   // n = 3 (3 ways): 1s + 1s + 1s | 1s + 2s | 2s + 1s
   // n = 4 (5 ways): 1s + 1s + 1s + 1s | 1s + 1s + 2s | 1s + 2s + 1s | 2s + 1s + 1s | 2s + 2s |
   if (n <= 2) {
       return n;
   if (memo.find(n) != memo.end()) {
       return memo[n];
   memo[n] = climbStairs(n - 1) + climbStairs(n - 2);
   return memo[n];
```

# **Problem – 1143. Longest Common Subsequence**

**LeetCode** 

https://leetcode.com/problems/longest-common-subsequence

Problem Statement / Solution / Code Time: O(-) Space: O(-)

•

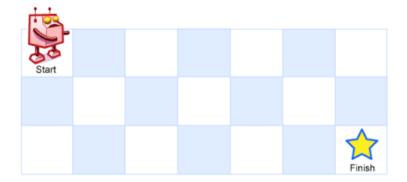

https://leetcode.com/problems/unique-paths

### **Problem**

- The robot is placed in a m x n grid
- It starts at the top-left cell (0,0) and must reach the bottom-right (m 1, n 1)
- The robot can only move right or down at any point
- Return the number of unique paths the robot can take to reach the destination

https://leetcode.com/problems/unique-paths

### **Solution 1 (recursive)**

- Define a recursive function countPaths(m, n)
- Base case

If m == 1 or n == 1, there's only one way to reach that cell (either all downs or all rights).

### Recursive case

To reach cell (m, n) the robot must come from:

Cell (m - 1, n)  $\rightarrow$  from above

Cell (m, n - 1)  $\rightarrow$  from left

So the number of of paths to (m, n) is the **sum** of the paths to those two cells

### Memoization

Use a 2D vector[m + 1][n + 1]

# Code – 62. Unique Paths

**LeetCode** 

https://leetcode.com/problems/unique-paths

```
Code Time: O(m * n) Space: O(m * n)
```

```
int countPaths(int m, int n, vector<vector<int>>& memo) {
   if (m == 1 || n == 1) return 1;
   if (memo[m][n] != -1) return memo[m][n];
   memo[m][n] = countPaths(m, n - 1, memo) + countPaths(m - 1, n, memo);
   return memo[m][n];
}
int uniquePaths(int m, int n) {
   /*
      count(m, n) = count(m, n + 1) + count(m + 1, n)
      same as (imagine robot going from m, n to 0,0 up and left)
      count(m, n) = count(m, n - 1) + count(m - 1, n)
   */
   vector<vector<int>> memo(m + 1, vector<int>(n + 1, -1));
   return countPaths(m, n, memo);
}
```

https://leetcode.com/problems/unique-paths

### **Solution 2 (iterative)**

- Create a 2D vector dp of size  $(m+1) \times (n+1)$  to store intermediate results
- Set dp[1][1] = 1 because there is exactly one way to stand on the starting cell
- Iterate through each cell (row, col) from (1, 1) to (m, n):
  - Skip (1, 1) since it's already initialized
  - For every other cell, the number of unique paths to it is the sum of:
    - Paths from the cell above: dp[row-1][col]
    - Paths from the cell to the left: dp[row][col-1]

dp[row][col] = dp[row - 1][col] + dp[row][col - 1]

# Code – 62. Unique Paths

**LeetCode** 

https://leetcode.com/problems/unique-paths

### Code Time: O(m \* n) Space: O(m \* n)

```
int uniquePaths(int m, int n) {
    vector<vector<int>> dp(m + 1, vector<int>(n + 1));
    dp[1][1] = 1;
    for (int row = 1; row <= m; ++row) {
        for (int col = 1; col <= n; ++col) {
            if (row == 1 && col == 1) continue;
                 dp[row][col] = dp[row-1][col] + dp[row][col-1];
            }
    }
    return dp[m][n];
}</pre>
```

```
// Optimized 1DP
int uniquePaths(int m, int n) {
    vector<int> dp(n, 1); // base case: first row is all 1s
    for (int row = 1; row < m; ++row) {
        for (int col = 1; col < n; ++col) {
            dp[col] = dp[col] + dp[col - 1];
        }
    }
    return dp[n - 1];
}</pre>
```

# Solution - 62. Unique Paths

https://leetcode.com/problems/unique-paths

### **Solution 3 (combinatorics)**

• Grid size: m x n

• **Start:** top-left cell (0, 0)

■ End: bottom-right cell (m – 1, n – 1)

To get from the top-left to the bottom-right:

You must move exactly m - 1 times down

And exactly n - 1 times right

These two types of moves must be made in some order, with a total of:

$$(m-1) + (n-1) = m + n - 2 moves$$

■ **Hence,** from a sequence of m + n - 2 moves, choose m - 1 of them to be down moves (the rest will be right), or vice versa

Number of unique paths = 
$$\left(\frac{m+n-2}{m-1}\right) = \frac{(m+n-2)!}{(m-1)!(n-1)!}$$

# Code – 62. Unique Paths

```
LeetCode
```

https://leetcode.com/problems/unique-paths

### Code Time: O(min(m,n)) Space: O(1)

```
int uniquePaths(int m, int n) {
    // we will compute the binomial coefficient:
    // (m + n - 2) choose (m - 1) => total moves choose down moves
    // = (m + n - 2)! / ((m - 1)! * (n - 1)!)

long long res = 1;

// we compute the result iteratively to avoid large factorials
// res = (n) * (n+1) * ... * (m+n-2) / (1 * 2 * ... * (m - 1))

for (int i = 1; i <= m - 1; ++i) {
    // multiply numerator: (n - 1 + i)
    // divide by denominator: i
    res = res * (n - 1 + i) / i;
}

return (int)res;</pre>
```

# **Problem – 983. Minimum Cost For Tickets**

# Problem - 198. House Robber

leetcode.com/problems/house-robber

### **Problem**

- You are robbing houses lined up in a row
- Each house has a cash value nums[i]
- You cannot rob two adjacent houses
- Goal: maximize total money robbed without triggering alarms

leetcode.com/problems/house-robber

### **Solution**

- Solve as a DP problem
- dp represents the maximum value you can get once rob only i or the previous houses
- At each "house" i, you can either rob or skip

### Example

```
nums = [1,2,3,1]
at position i = 0, you can have two options:
rob: you end up with 1; or skip: you end up with 0
at position i = 1
rob: you get 2 + total of two houses before; or skip: total of robbed before
```

Therefore:

**LeetCode** 

leetcode.com/problems/house-robber

# int rob(vector<int>& nums) { int n = nums.size() + 1; // base case: start dp[0] = 0 (no rob) // dp[1] = nums[0] vector<int> dp(n, 0); dp[1] = nums[0]; for (int i = 2; i < n; ++i) { int numPos = i - 1; // if I rob int rob = nums[numPos] + dp[i - 2]; // if I skip int skip = dp[i - 1]; dp[i] = max(rob, skip); } return dp[n - 1];</pre>

```
E LeetCode
```

leetcode.com/problems/house-robber

# Code (space optimized) Time: O(n) Space: O(1)

```
int rob(vector<int>& nums) {
    int prev = nums[0];
    int prev2 = 0;

for (int i = 2; i <= nums.size(); ++i) {
       int numPos = i - 1;
       // if I rob
       int rob = nums[numPos] + prev2;
       // if I skip
       int skip = prev;
       prev2 = prev;
       prev = max(rob, skip);
    }
    return prev;
}</pre>
```

# Problem - 213. House Robber II

leetcode.com/problems/house-robber-ii

### **Problem**

- Similar to House Robber I but with a new constraint:
- You are robbing houses lined up in a circle
- Each house has a cash value nums[i]
- You cannot rob two adjacent houses
- You cannot rob the last and first houses at the same time
- Goal: maximize total money robbed without triggering alarms
